The present sequence represents a mammalian serine racemase, which has a specific activity of at least 0.003 micromole L-serine/mg/hour. The enzyme catalyyses the direct racemisation of L-serine to D-serine. D-serine appears to be an endogenous ligand of N-methyl-D-aspartate (NMDA) receptors. The mammalian serine racemases can be used to identify modulators, which can be used in the treatment of acute or chronic neural death or dysfunction mediated by overactivation of N-methyl-D-aspartate (NMDA) receptors. Overactivation of the receptors is associated with Parkinson's disease, Huntington's disease, motor neurone
                                                                                                                                                                                                                                                                                                   which can be used to treat diseases associated with N-methyl-D-aspartate receptor overactivation, e.g. Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           LNAIRGLIPDTPEEKPKAVVTHSSGNHGQALTYAAKLEGIPAYIVVPQTAPNCKKLAIQA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a mammalian serine racemase, which has a specific activity of at least 0.003 micromole L-serine/mg/hour. The enzyme catalyses the direct racemisation of L-serine to D-serine. D-serine appears to be an endogenous ligand of N-methyl-D-aspartate (NMDA) receptors. The mammalian serine racemases can be used to identify nedulators, which can be used in the treatment of acute or chronic neural death or dysfunction mediated by overactivation of N-methyl-D-aspartate (NMDA) receptors. Overactivation of the receptors is associated with Parkinson's disease, Huntington's disease, motor neurone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                    Mammalian serine racemase preparations, used to identify modulators which can be used to treat diseases associated with N-methyl-D-aspartate receptor overactivation, e.g. Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 MCAQYCISFADVEKAHINIQDSIHLTPVLTSSILNQIAGRNLFFKCELFQKTGSFKIRGA

identifying compounds that alter enzyme activity (e.g. including compounds that inhibit or stimulate enzyme activity) or in generating antibodies against the protein useful in assays for recombinant serine racemase polypeptide,

Claim 7; Page 14; 43pp; English.

human serine racemase, vectors containing it, host cells expressing the racemase, methods of identifying inhibitors of serine racemase and a tracemase, methods of identifying inhibitors of serine racemase and a transgenic animal lacking a functional endogenous serine racemase comprising the human serine racemase of the invention. The racemase comprising the human serine racemase of the invention. The racemase comprising the human serine racemase of the protein and in structural studies of the protein and structural studies of the protein and structure/function relationships of the protein. Biologically active fromedion and mutant or polymorphic forms of the serine racemase colypeptide have diagnostic, therapeutic or prophylactic uses (e.g. carvicty, glaucoma, strucke, hyperalgesia, pain, spinocerebellar ataxia and schizophrenia), and would be useful for sceneing for modulators and/or inhibitors of serine racemase function. The polynucleotides are useful as protein as probes for the specific detection of the presence of a polynucleotide encoding a serine racemase protein. The transgenic animal is useful for the study of the tissue and temporal specific expression or activity of the study of the tissue and temporal specific expression or activity of the strine racemase gene in an animal. The gene for human serine represents human serine

                                                                                                                                                                                                                                                                               The present sequence is human pyridoxal phosphate dependent enzyme 22406 which is a serine racemase. Human 22406 gene is located on chromosome 17 between D178349 and D178796. The protein 22406 is a modulator of D-serine. D serine has been shown to modify behavioural changes associated with learning, memory and convulsions. Human 22046 and compounds that modulate the expression or activity are used to treat or diagnose neurodegenerative disorders including Alzheimer's disease, schizophrenia as well as quell anxiety and epilepsy and prevent damage from stroke as well as cardiac (heart failure, rheumatic heart failure) and circulatory disorders, liver disorders (hepatic injury, jaundice), lung disorders, prostrate disorders (benign enlargement, nodular hyperplasia), colon disorders (atresia, stenosis), skeletal muscle disorders (tumours-rhabdomyosarcoma) and dermal fibroblast disorders. Human 22406 cDNA is also useful in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           300

```
polynucleotide which comprises a 3-april graduate the polynucleotide which comprises a 1-april graduate, where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-and sequence/3'-and sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              LNAIRGLIPDTPEEKPKAVVTHSSGNHGQALTYAAKLEGIPAYIVVPQTAPNCKKLAIQA 120

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dr primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprision a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                represent oligonucleotides, all of which are used in the exemplification
